CIT2011 / INDIVIDUAL ASSIGNMENT 2

Coding Conf 2026

Dynamic Event Registration System

Student: Jayden Peterson

Student ID: 2400651

Programme: BSc Computer Information Systems

University: University of Technology, Jamaica

Lecturer: Sirisha Badhika

Course: CIT2011 - Web Programming

Due: October 31, 2026 at 11:59 PM

Project overview

A responsive three-page website for a fictitious coding conference. Visitors explore the event, complete a registration form and receive a personalised digital ticket. The required event metadata is October 26, 2026 at Papine, Kgn.

Technology

Semantic HTML5, custom CSS3 and native JavaScript. No framework, utility stylesheet, external font or build process is required. Supplied assets are stored locally.

Publication status

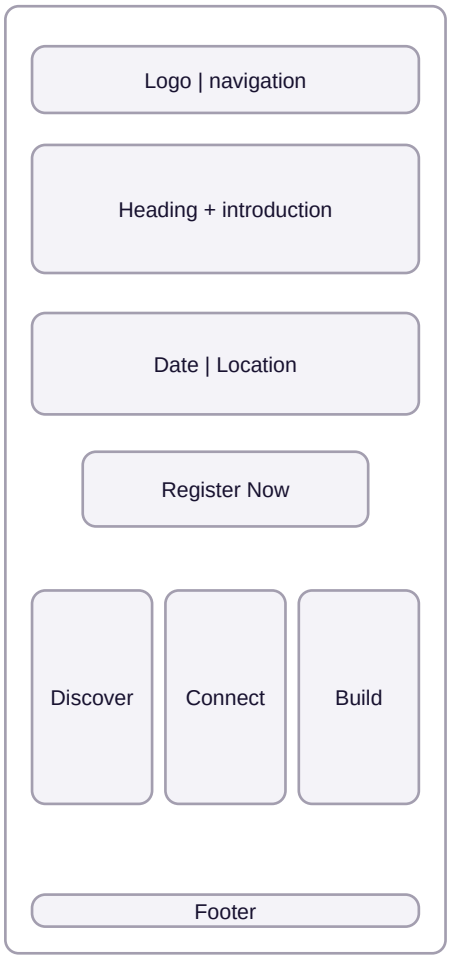

GitHub: https://github.com/jayxutech/2400651_IA2_S1AY27
Live site: https://jayxutech.github.io/2400651_IA2_S1AY27/HTML/index.html

The project source is published to the student GitHub account with free GitHub Pages hosting. The course portal has not been updated.

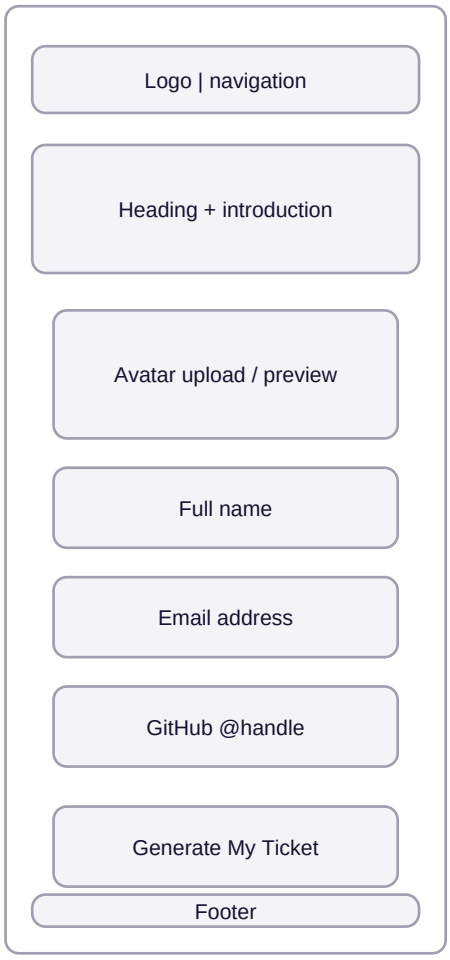

Layout wireframes

Desktop structure and registration workflow

index.html

login.html

ticket.html

Page flow

index.html -> login.html -> ticket.html. Invalid form input stays on the registration page. Missing or malformed ticket data redirects the visitor to index.html.

Shared visual system

Dark purple backgrounds, coral actions, pale text and transparent panels. The ticket uses a translucent gradient, blurred backdrop, thin border and a dashed serial divider. Header and footer remain consistent across all pages.

Mobile wireframes

Content-first layout with a single-column form

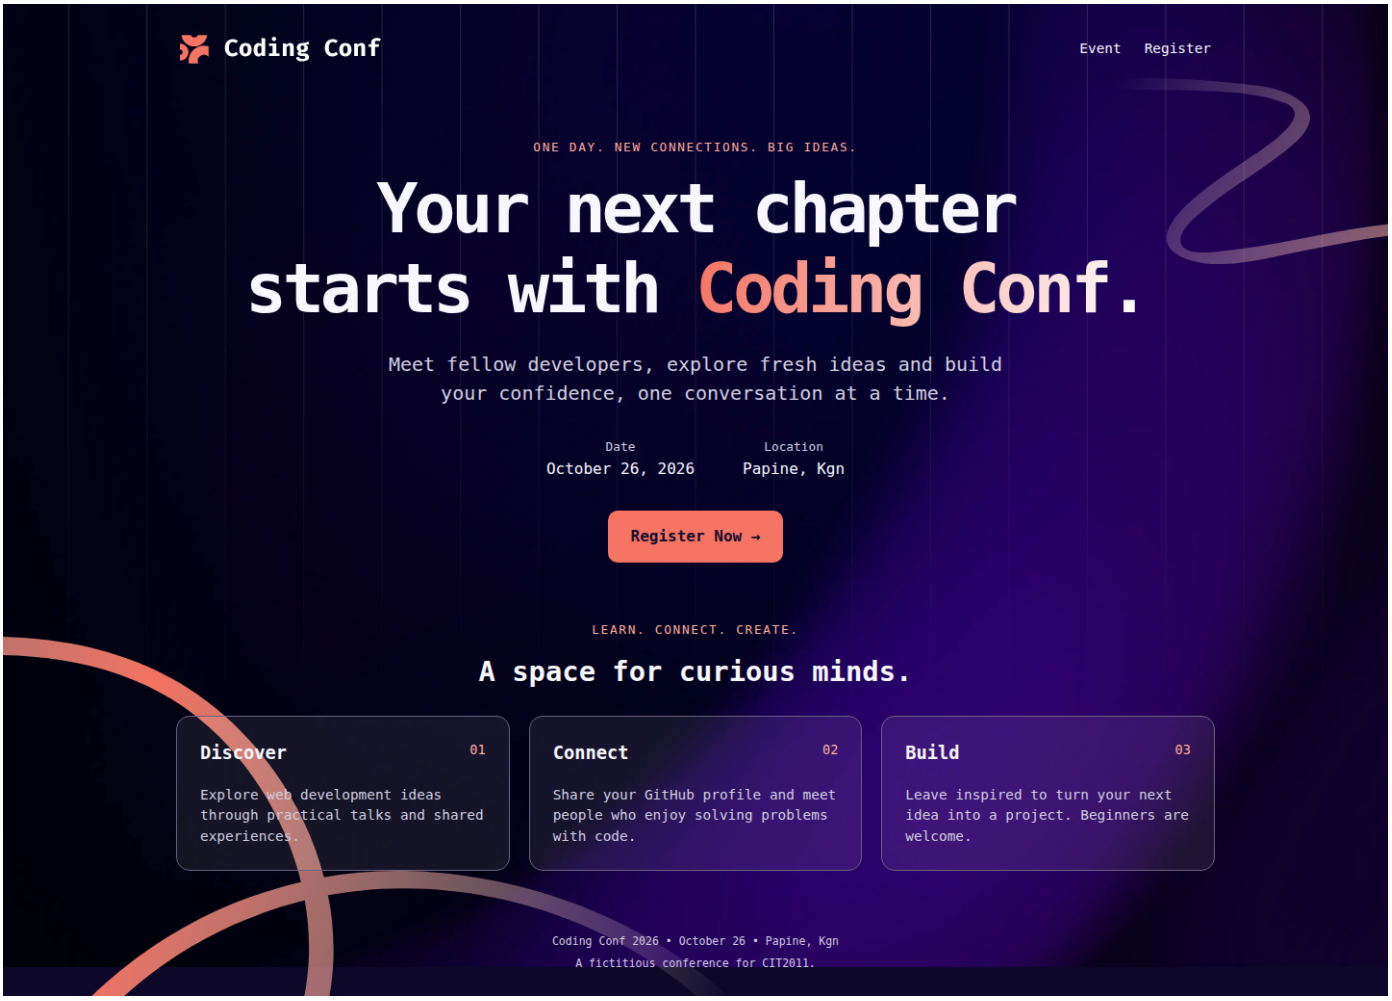

Responsive decisions

The event cards stack on small screens. Typography scales with clamp(). Form controls stay full width. Ticket padding, avatar dimensions and the serial divider shrink at 520px; the desktop feature grid adjusts at 800px. Long names and filenames wrap.

Event page

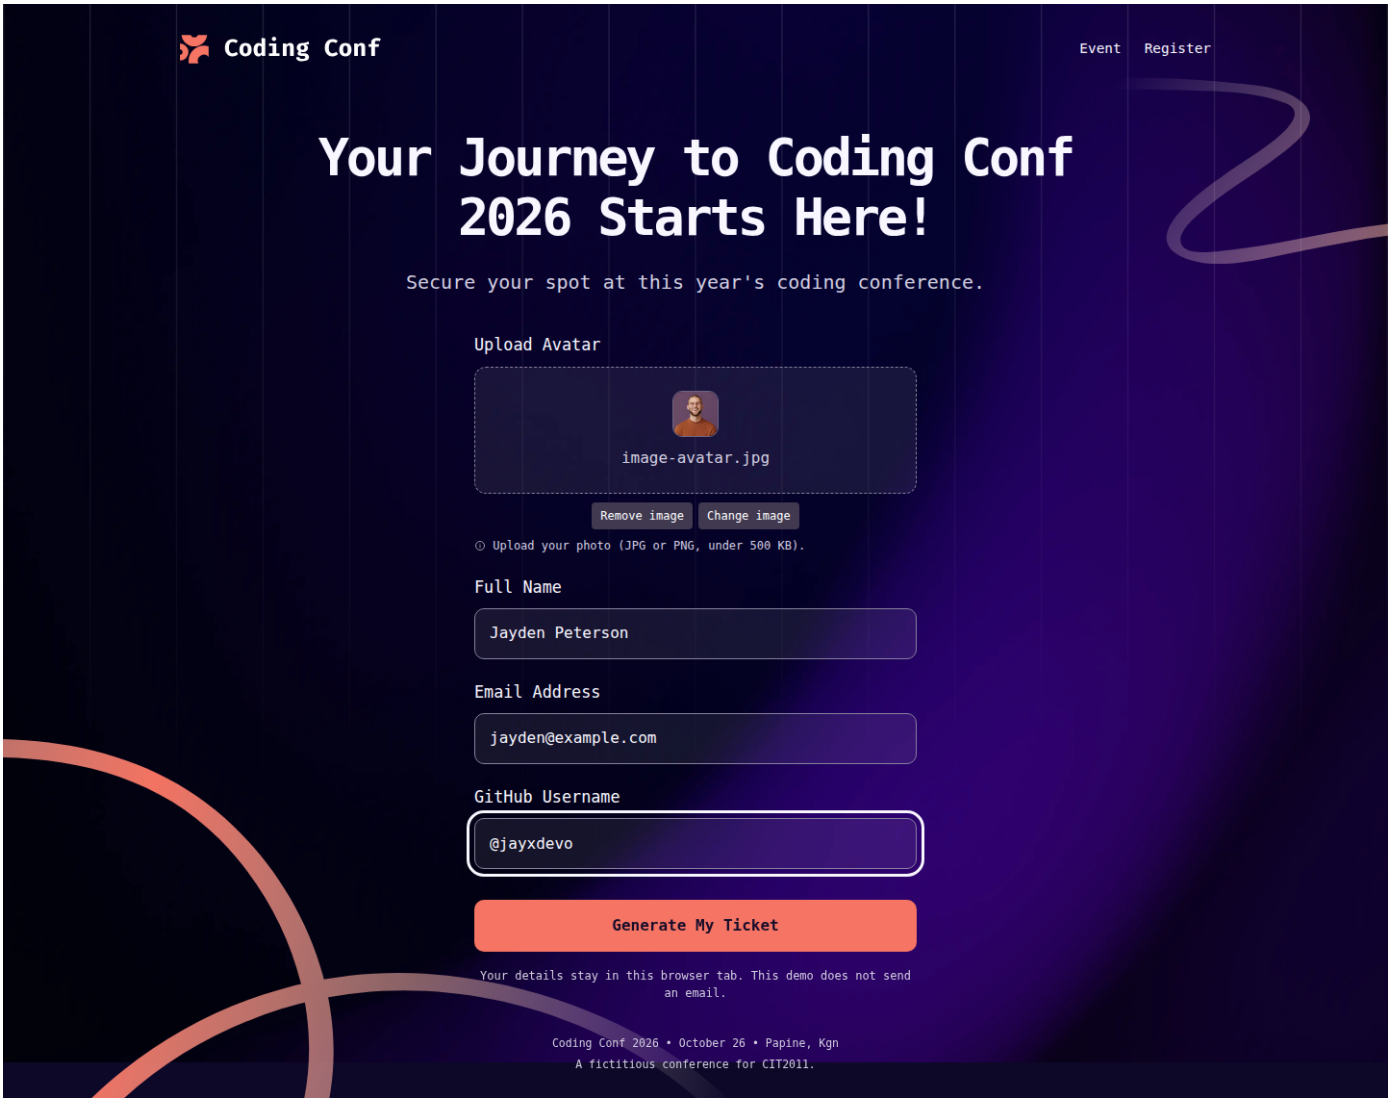

Desktop browser screenshot - 1440 x 1000 viewport

Captured from the running local application in headless Chromium. Sample photo supplied with the assignment.

Registration page

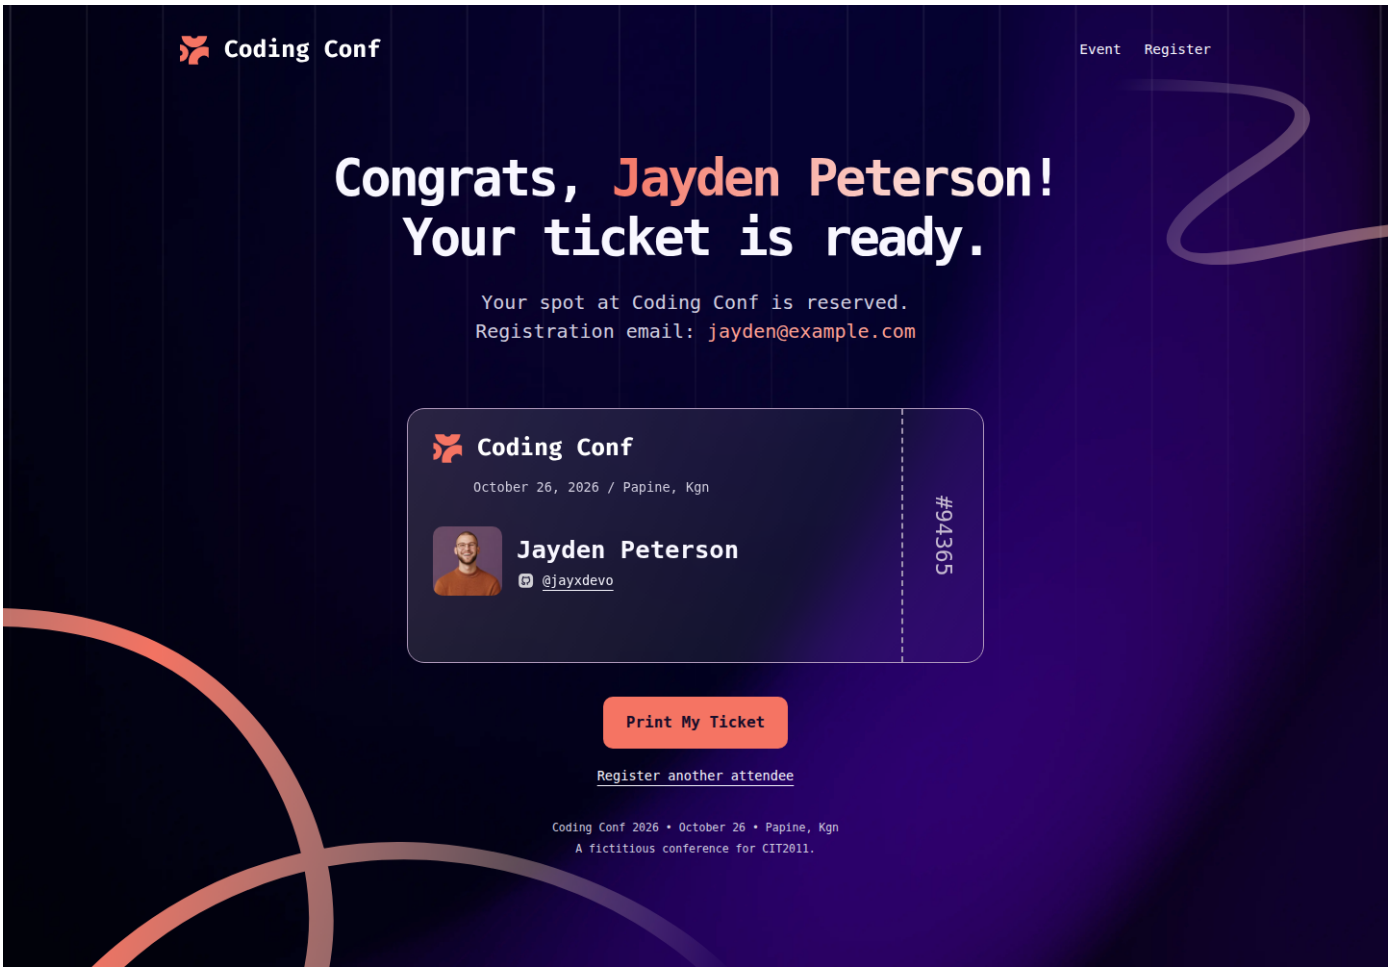

Completed sample form - 1440 x 1100 viewport

Captured from the running local application in headless Chromium. Sample photo supplied with the assignment.

Ticket confirmation

Desktop browser screenshot - 1440 x 1000 viewport

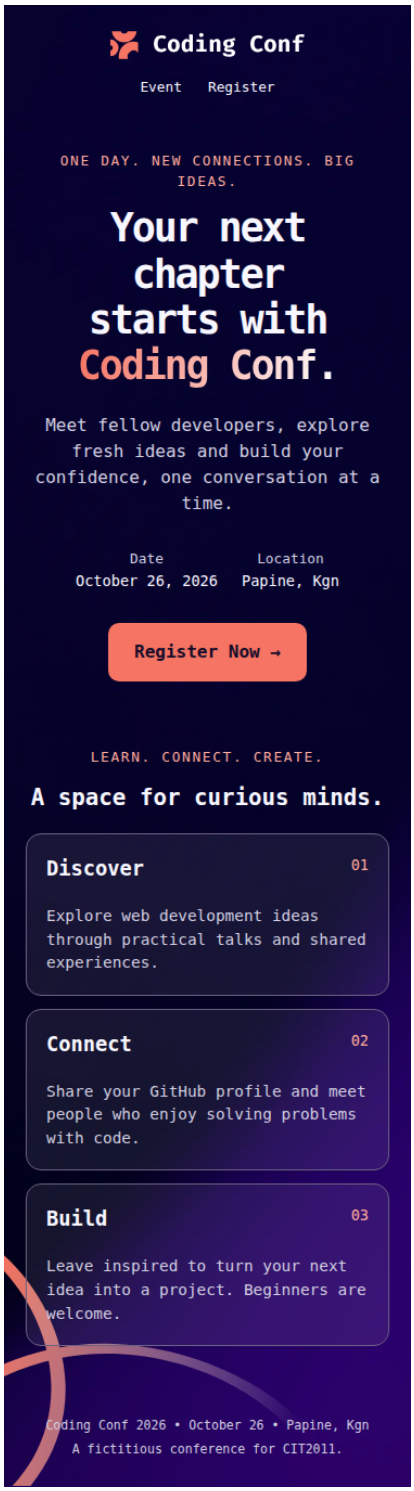

Captured from the running local application in headless Chromium. Sample photo supplied with the assignment.

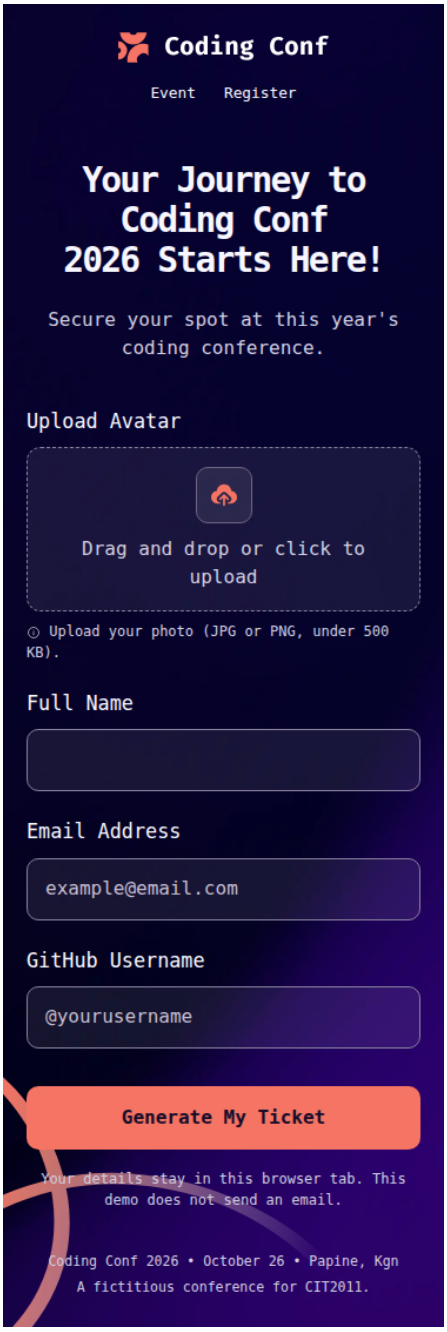

Responsive test evidence

Mobile browser viewport - 375 x 812

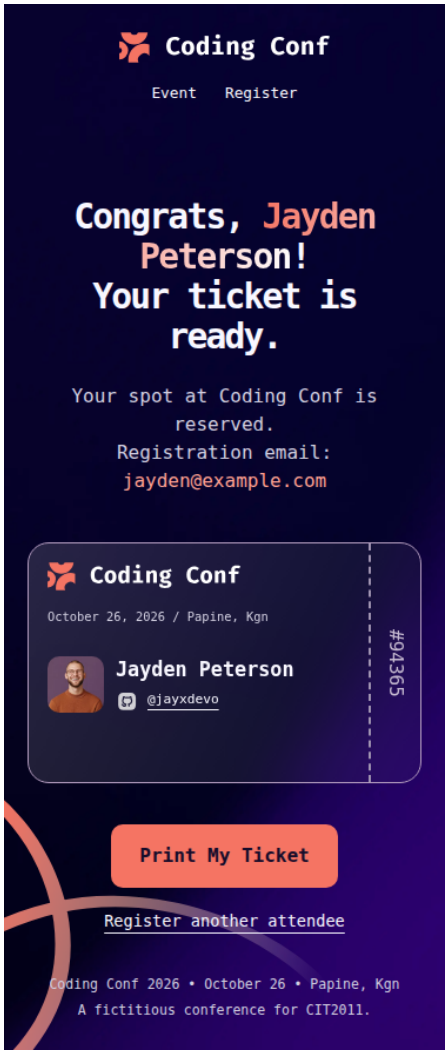

Event

Registration

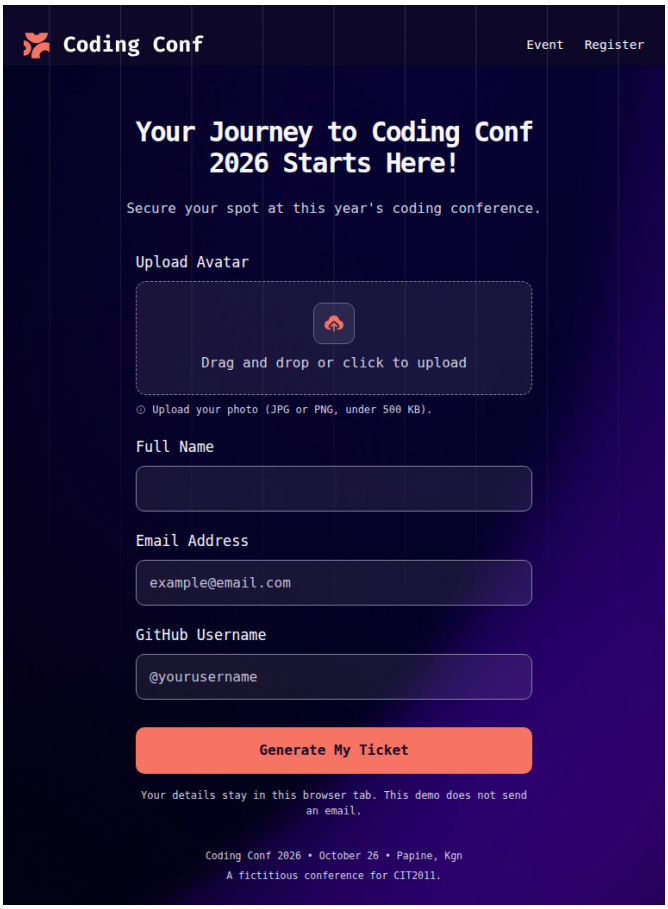

Ticket

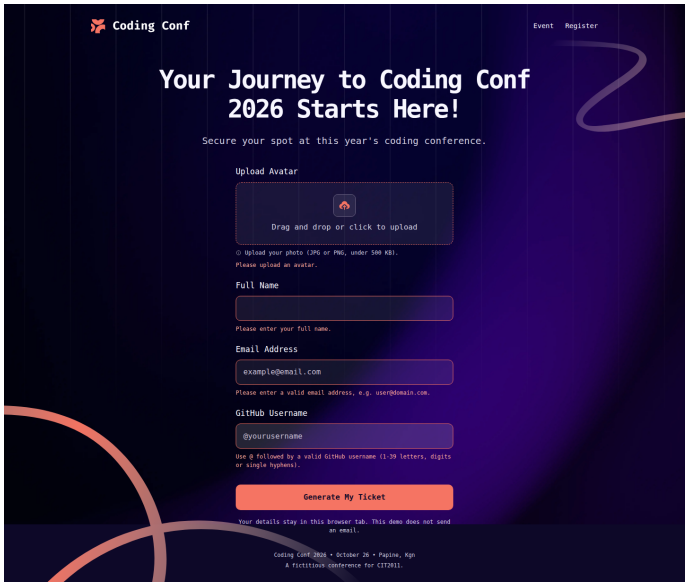

Additional tablet (768 x 1024) and small mobile (320 x 812) screenshots are included in the documentation folder. All three pages fit each tested viewport without horizontal scrolling.

Tablet and validation

Responsive layout and contextual form feedback

Left: registration form at 768 x 1024. Right: all required fields rejected after an empty form submission at desktop width.

Accessible interactions

The site uses semantic headings and landmarks, explicit labels, a skip link, visible keyboard focus, useful avatar alternative text and error messages associated with their fields. Decorative icons have empty alternative text. Reduced-motion preferences disable transitions.

The avatar control supports keyboard file selection, clicking and drag/drop. Repeated input groups share :is() / :where() rules; :has() connects the upload container to the input focus and error state.

Verification and handover

Local browser tests, sample data and publication steps

Sample registration details

Name: Jayden Peterson | Email: jayden@example.com | GitHub: @jayxdevo. Select assets/images/image-avatar.jpg as the test photo. This sample photo does not represent the student. No password is required.

Verified in Chromium

- Landing, registration and ticket views fit 1440px, 768px, 375px and 320px widths.
- Empty form submission shows errors for all four required inputs.
- Whitespace-only name, malformed email and a GitHub tag without @ are rejected.
- Wrong image types, files at the 500 KB limit and undecodable images are rejected.
- Photo preview, removal, replacement and a valid registration work.
- Ticket renders the entered name, email, photo, GitHub link and serial; refresh preserves it.
- Missing or corrupt stored state redirects direct ticket access to the landing page.
- No JavaScript runtime errors occurred during the workflow tests.

How to run and publish

Extract the ZIP and open HTML/index.html, or serve the root with python -m http.server 8000 and visit /HTML/index.html. The source is published in the GitHub repository on page 1. GitHub Pages serves the project with /HTML/index.html as the live entry path. The root index redirects to this page.

Scope and review

This client-only demonstration stores attendee data in sessionStorage for the current tab. It does not send email, authenticate users or issue centrally unique booking numbers. Only Chromium was tested. Weeks 1-6 course notes were not provided; the student must review compliance with taught material and be able to explain the submitted code.
